

# E370 Firmware Release V1.6b – Sept 28, 2021

This update is the replacement for V1.6, as well as the beta V1.6a and should be installed in all V1.6 E370s or older.

The main update supports a new FLASH memory chip used on E370s serial #680 and above. It is backwards compatible with serial numbers 001-679, and rather than take your module out of the case just to check the serial number, please just load it in anyway 😊

Bug fixes from V1.6

- a) Fixed issues with reading names of files/patches correctly
- b) Fixed issues with some uSD cards not loading properly

Bug fixes from V1.6a (beta)

- a) Support for new FLASH memory chip (backwards compatible with the older one, too)
- b) Fixed issue of right margin clipping on some LCD menus

This update does not change any calibration or user settings.
